Second Lockheed Martin GPS III Satellite Successfully Completes Test Simulating Strenuous Launch Environment

GPS III Space Vehicle 02 Completes Acoustic Testing

The U.S. Air Force's second GPS III satellite, GPS III SV02 (above), recently completed acoustic testing, which simulates the stress the satellite will experience during launch.

DENVER, Sept. 5, 2017 /<u>PRNewswire</u>/ -- Launch is the most strenuous part of a satellite's life. To survive the extreme sound wave pressure and pounding vibrations generated by more than 700,000 lbs. of thundering rocket thrust, spacecraft need a solid, reliable design if they hope to arrive operational on orbit.

On July 13, Lockheed Martin (NYSE: LMT)'s second, fullyassembled GPS III space vehicle (SV) completed a realistic simulation of its future launch experience and passed this critical <u>acoustic environmental test</u> with flying colors.

During acoustic testing, the GPS III SV02 satellite was continuously blasted with deafening sound reaching 140 decibels in a specialized test chamber equipped with highpowered horns. For comparison, that is about as loud as an aircraft carrier deck and human hearing starts to be damaged back at about 85 decibels. The test uses sound loud enough to literally shake loose anything not properly attached.

"With this launch-simulation test, we are talking about sophisticated, advanced satellite technology and electronics enduring tremendous forces and then working flawlessly afterward," said Mark Stewart, Lockheed Martin's vice president for Navigation Systems. "Passing this test with GPS

III SV02 further validates the robustness of our GPS III design. We credit this success and riskretirement to all the pathfinding work we accomplished early in the program."

The <u>GPS III SV02 satellite</u> is part of the U.S. Air Force's next generation of GPS satellites and will bring critical new capabilities to the warfighter. GPS III will have three times better accuracy and up to eight times improved anti-jamming capabilities. Spacecraft life will extend to 15 years, 25 percent longer than the newest GPS satellites on-orbit today. GPS III's new L1C civil signal also will make it the first GPS satellite to be interoperable with other international global navigation satellite systems.

GPS III SV02 is Lockheed Martin's second GPS III satellite to successfully complete acoustic testing. The company's first satellite, GPS III SV01 – which is in storage awaiting its expected 2018 launch – completed acoustic testing in 2015.

The GPS III SV02 satellite is now being prepared for Thermal Vacuum (TVAC) testing this fall, where it will be subjected to extreme cold and heat in zero atmosphere, simulating its on-orbit life. The satellite is expected to be delivered complete to the Air Force in early 2018.

GPS III SV02 is the second of 10 GPS III satellites Lockheed Martin is contracted for and is assembling in <u>full production</u> at the company's GPS III Processing Facility near Denver. The \$128 million, state-ofthe-art manufacturing factory includes a specialized cleanroom and testing chambers designed to streamline satellite production.

Lockheed Martin's unique GPS III satellite design includes a flexible, modular architecture that allows for the insertion of new technology as it becomes available in the future or if the Air Force's mission needs change. Satellites based off this design are already proven compatible with both the Air Force's next generation <u>Operational Control System (OCX)</u> and the <u>existing GPS constellation</u>.

The GPS III team is led by the Global Positioning Systems Directorate at the U.S. Air Force Space and Missile Systems Center. Air Force Space Command's 2nd Space Operations Squadron (2SOPS), based

at Schriever Air Force Base, Colorado, manages and operates the GPS constellation for both civil and military users.
